Regardless of whether you are new to dying cutting, needing some clarification, or having a certain question in the dying cutting field, we are here to provide you with some answers! Find your question below or use the content bar on the page to help you navigate. Also check out the bottom of this site for additional resources on die cutting, including tips and tricks and more! Looking for Machines, Tools and Supplies Die Cutting? Look here for thousands of dying stock cuts. What is dying cutting? Die cutting is a broad term, but in the craft, the act of die cutting refers to the process in which you use a machine to mass produce cut out shapes. You can create the same shape, with the same dimensions, over and over again, without the use of scissors, stencils, or a craft knife. This saves time and makes your cut out shapes look professional and consistent each time. What is a death-cutting machine? Die cutting machines are machines made of paper, particle board (such as cardboard, but thicker and denser), fabrics and other materials. Most people who die regularly cutting have personal death-cutting machines that are about the size of a small brick oven. These machines can sit at the top of your craft table or workspace, or store them in a smaller area and pull them out as you need. There are even tiny versions of the tablet, such as Sidekick or Mini Evolution, and compact folding versions such as the Sizzix Big Shot Fold. Like any other appliance or tool, there are different brands of die cutting machines, and each is slightly different from the other. You can also check this source for cutting machines. It will give you an overview of different styles so you can choose the right machine for your needs. What is a handheld cutting machine die? Hand-held die cutting machines are operated with a handle or handle for easy turning and use specialized metal forms for cutting paper and other materials. Sometimes these machines will also have a powered component that will help to operate the machine with electricity. When material and metal die through the machine's rollers, it puts pressure on and dies cutting paper or other material into the form of die. The most popular hand machines are manufactured by Sizzix, We R Memory Keepers and Spellbinders. What is a digital die cutting machine? Digital die cutting machines are powered by electricity and are controlled by computer software or cartridges. Digital cutters do not require steel to die because they have a blade inside the machine that cuts paper or other materials. You can choose the format you want to create through a program on your computer, phone, tablet, or specialized cartridge for your computer. The most popular digital die cutting machines are made by Silhouette and ProvoCrafter's Cricut. Digital die cutters look like consumer printers and connect to a computer using a USB or Bluetooth technology similar to a printer or other You can purchase digital files that you want to cut or preloaded pictures on them! What is death? When cutting die, objects are killed in the form of metal with a raised, sharp cutting area. They look and feel similar to cookie cutters - the die shape is a shape that will cut out on your paper. There are a few different types of death. Steel deaths are sharp and protected by foam or plastic material (for your safety). They are usually more durable as they are designed to cut thicker materials, or multiple incisions all at once. Thin metal is not as sharp and can not cut such thick materials as steel-rule can die. They are more similar to your traditional cookie cutter - a metallic form, with no round foam or plastic, and easier and easier to store. Dies come in a wide range of sizes and styles. There are basic shapes, words, emotions, intricate flowers, delicate lace, animals, food shapes and almost everything you can think of. With so many deaths, there is death for every purpose and opportunity! What are the machines used for cutting die? Although die cutting machines vary (you'll want to read the specifications of the machine before buying) all the dead cutting machines are cutting paper. Most also cut felt, foam, thin fabric, and vinyl- although it's about the fact that just a steel rule dies can be a cutting point. Some can even cut cork, leather, rubber and sponge! Die cutting machines can be used to make stickers, envelopes, stand-up cards, gift cards, treatment bags, party favors, shaker cards, pillow boxes, and more. They are used by card makers, scrapbookers, paper craftsmen, edies and general artisans. They are even used in classrooms to facilitate learning and project creation. Which cutting machine is best? It depends on your needs and what you're looking for. Sizzix Big Shot is the most popular handheld machine for cutting die die. However, there are many different machines with many different features, advantages and disadvantages. When buying a die cutting machine, it's important to read product descriptions and reviews to see what each machine is best for and what other people have to say about them and their experiences. If you are thinking of buying a die cutting machine, this article will help you make the right choice for you. Where did he die cutting his name? Why is it called die incision? The origin of the word go back to 1300-50, the middle English die. In Latin, the word is a date. The word die as it is today, in this context, probably comes from this origin. da, dana, dana, dana, give means also gaming, or gaming. In the meantime, death refers to burning processes such as creating coins or casting objects - usually in metal - from dying. In the 1800s a new invention was created for mass production - die cutting. The old die expression (creation by working) was combined with cutting (an action of cutting the shape) to create the expression die cutting. It is not known who first forged the term die cutting, which in the English lexicon in the mid-1900s. Who invented dying? Die cutting was invented in the mid-1800s to help streamline the shoemaker industry. Since the cutting of the bases was previously made by hand, usually from leather, the process was lengthy, hard-working and expensive. The invention of the die cutting machine revolutionized the work for footwear and made the shoes much more consistent, as the shapes were always cut out the same size, in the same way, rather than by hand. This meant that shoes could now change as standard as a result. In the early 1900s, when technology progressed, the cutting machine died, too. The invention of the hand-side cutting machine has enabled different sizes and shapes of the deceased, which means that footwear can create any part of the shoe they need with the machine - and the same machine on it. Shoes have become easier to make and also much more accessible to all people. It wasn't until 1977 that bob and LaDorna Eichenberg, the creator of Ellison, were invented by the first hand-operated death-cutting machine for consumers. Since then, die cutting machines have grown and transformed in the booming craft industry! Cool, isn't it? Who uses death cutting? Die cutting is used in the manufacture of various items such as shoes and other objects, by cutting components quickly and efficiently, with complete cutting each time. In production processes such as this, large industrial strength cutting machines are usually used to speed up the process and withstand the constant pressures of heavy workload. Artisans also use die cutting, usually with personal die cutting machines purchased in scrapbooking or craft shops. Artisans can use these machines to cut items for cards, scrapbook pages, home decor, party favors, party banners, DIY projects, gift, and more, quickly and easily without the need to use scissors. What do you need to start dying cutting? In order to die an incision, there are only a few essential objects. Most machines come with everything you need to start dying cutting right away (except for dying). For hand-made machines, which constitute machine, platform and cutting inserts. For digital machines this means that the actual machine and software to start. Machines usually include detailed instructions explaining how to use the machine and accessories. Dying, cartridges and cut-out files are sold separately. And if you still need help there are videos and classes online to guide you. When you buy a handheld machine, you will also need at least one die to start dying cutting. Here you can find deaths in different styles and sizes. And of course you'll need paper or cardboard to cut out your shape. These are the only items you need to start dying cutting. Where can I buy a cutting machine? If you are looking for where to buy die cutting machines, they can usually be purchased in a craft shop or online. We carry all the best-selling hand-cutting machines. You can read hundreds of die cutting machine reviews of verified owners, peruse questions and answers about machines, and determine which machine is right for you. If you are brand new to die cutting, you want to present it to someone else, or are in great need of an upgrade, buying an affordable die cutting bundle will get you everything you need to die cutting, which includes the machine and your choice of die shape. How does cutting work die? For hand-cut machines, a piece of paper shall be placed on the machine platform. Then, to die in the form you would like to cut it icy on top of a piece of paper. When he dies positioning where you would like to make the incision, place a plastic mat on top of the paper and die to hold them in place and act like a sandwich. When everything is in place, the handle is twisted manually, which feeds the platform through the machine. When the platform passes through the machine, a uniform pressure is placed on the mat, dying in paper by pressing the metal. Sharp edges die to cut through the paper to create the desired shape. The platform then comes out on the other side of the machine and you can take off the top of a clear pad to access your die, paper, and fully cut shape! How much does cutting death cost? Dying cutting is an initial investment. Think of it as a stitch- up. The front has some costs to need to start, but once you have the essentials purchased, the following costs are all extras, as trendy dies from new collections, papers and other cutting materials as needed. Personal dying cutting machines can cost anywhere from a low of \$30 for small handheld machines to hundreds of dollars for fancy electronic machines. Typically, however, hand-held cutting machines tend to be in the price range of \$50- \$200, while electronic or digital are slightly more. When you buy a die cutting machine, all the elements you need are included, but they are almost always optional accessories that you can buy to make die cutting easier or make your machine more versatile. Tools and accessories start at just a few dollars and go from there up. The only other expenditure can be budget very subjective. Dies can come at different prices, from \$2.00 or less for small, simple dies, to more than \$100 for decorating sets more dies. Overall, however, die packs tend to fall into the \$10 - \$30 price range and usually come with more die. Here you can see different options and prices. Can you do cutting to die? Although it is technically possible to die yourself from metal by welding, this is not recommended. Dies are often specially designed for certain machines and are made according to certain specifications to ensure that they work properly. Creating your own dies and running them through your machine can damage your machine, irreversible and invalidate the warranty. Popular craft brands create their metal die carefully from high-quality materials to make sure bend, pin or not cut the paper. What are die cut shapes? Die cut shapes are pieces of paper, cork, fabric or any other material that has been cut with die in form. Sometimes people also call die cut shapes like paper embellishment, cutouts, and ephemera. What are cutting pads or plates? Cutting pads or cutting plates create a die cut sandwich- an appropriate layer of all the components and materials for your machine. Building a sandwich ensures that you have the right necessities, materials and pressure to inspect your machine. Think of it as a hand over a cookie cutter when you press down. If you don't press the cookie cutter into the money, you won't make a cookie! The machine presses on the pad and pushes the dying into the paper and creates the perfect incision! Pads come in different sizes and colors (although color options are really just for fun). With time, your pads will have to be replaced for warping. It's normal and expected. What is a die cut sandwich? It's called a combination of platforms and mats. Different combinations of different sizes will perform different tasks and functions for your craft needs. There are books and manuals that give ideas and detailed instructions on how to create sandwiches with different platforms and mats. Sizzix makes a wonderful sandwich booklet that shows a lot of different ways to make them - and the book is even shaped like a sandwich! For example, when using thin metal, you would use a different sandwich than using it if you used a folder to make it. You didn't have to force a sandwich through the cutting machine. If you find it too hard to cut, try turning your sandwich around by using the handle the other way to take the sandwich out of the machine. If you try to force sandwiches through or hard cuts, you can damage your machine. It is very important that you read the instructions for proper use in full. Is cracking sound normal when cutting dies? It's perfectly normal to hear cracked noises as you turn your death through your machine. That sound is dying in your paper. It's perfectly normal, and no, you didn't break anything! Do you have to change the cutting pads? You'll need to change the pads over time. Warping and aching your pads will happen when time goes on - it's normal and expected. However, there are some things you can do to reduce excessive warping and to get the most longevity out of your pads! Use the entire surface pad when you cut do not cut in exactly the same place on the pad each time (use the middle and edges) Switch back and forth from using both sides of the pad, but turn it upside down or back - your pad can run through your machine in any direction (size permits) Picture above is a photo of a pad that is starting to warp and has a great ingeque from long life cuts! What are embossing Die cutting involves cuts to paper and other materials, while embossing is painting material on a particular shape, which it changes dimensionally. Embossing folders and die cutting go hand in hand because you need a manual die cutting machine in order to use special embossing folders. The pressure of the die cutting machine presses the models into your cardboard so that you have embodied (raised) and debossed (burglary) patterns. Some folders from Sizzix, Spellbinders and other top brands even combine embossing and die cutting into one folder, completing both campaigns during their journey through the machine. This means that the make folder will press pattern or formatting and cut out certain pieces for a truly unique shape on your paper. How are die cut stickers made? Making stickers at home is one of the many advantages of having your own personal death-cutting machine. Instead of using the card yourself, apply italics on the back of the card, and then continue cutting the shape. Run the paper through your machine with your death of choice, as you would normally - and voila! You made your self-beautiful back die, cut the shape - the label! Cut the fresh shape off the platform and peel the back of the adhesive sheet to reveal the sticky side. Buying correlation stamps and deaths can be very useful for making labels. Many companies, such as Lawn Fawn, Sizzix, and Concord and 9th, create stamps that have matching die, allowing you to stamp, paint, and cut out the perfect image every time. Can you die cutting fabric? Da! The fabric can absolutely die incision, however, some die and the machines are not durable enough to cut through heavy fabrics. Some of the best die cut fabric cutting machines are Sizzix Big Shot Plus and Sizzix Big Shot Pro. Make sure you read the specifications and details of the machine before purchasing if you plan to regularly cut heavier materials. It is also important that steel-rule dies cutting fabric best, as they are the most difficult duty to die. What is shim in dying cutting? Shim is an element that is designed to fill additional space and add pressure when necessary. In die cutting, shimmer is usually a piece of cardboard or two that can help keep your die from moving and provide extra pressure to die when it passes through the machine. This helps get a cleaner incision (see the next question when you might need a shimmer). What can I do when my detailed deaths are not cut out properly? Complex die often takes a little more effort to get them cut properly. Especially if you cut thick cardboard or specialty paper. Here are some tips that can help you get better results when using a very detailed die. Try to let your die in place and run it through your machine a second time (maybe even three times if needed). It's really easy if you're leading him one way, and then back to the other! If that doesn't work, add one sheet of cardboard as a shimmer under your death sandwich and run your death through the machine as usual. This will give you a little more pressure and help with those hard-to-cut areas within your death. If the karistock shim doesn't work, you can buy a thin metal shimmer to place under your die cut sandwich and run a die through your machine. If you still have problems, you may have a malfunction to die and you need to call the manufacturer to replace it.
